

Project Progress Report – CybersecHub

1. Current Features Implemented:

- **Authentication & Authorization:** Fully implemented using JWT and cookies.
- **Role Management:** Support for admin, user roles with guest access available for visitors without an account. User role state is managed on the frontend using Redux.
- **Frontend Pages:**
 - Home page
 - Category page
 - Submit tool page
 - Tool details page
- **Tools List:** Implement **all tools page**; filtering functionality is currently in progress.

2. Development Stage:

- **Frontend:** Approximately 80% complete. Most of the user interface components and client-side logic are finished, with only a few additional pages and interaction flows remaining.
- **Backend:** Approximately 50% completed.

3. Upcoming Features:

- Admin dashboard for reviewing and accepting tools.
- CRUD operations for managing categories.

4. Challenges Encountered:

- At the current stage of development, there have been no significant blockers or technical difficulties. The project team is able to make progress according to the planned schedule and architecture.

Description

Nmap ("Network Mapper") is a free and open source utility for network discovery and security auditing. Many systems and network administrators also find it useful for tasks such as network inventory, managing service upgrade schedules, and monitoring host or service uptime. Nmap uses raw IP packets in novel ways to determine what hosts are available on the network, what services (application name and version) those hosts are offering, what operating systems (and OS versions) they are running, what type of packet filters/firewalls are in use, and dozens of other characteristics.

Usage

Scan a single host:

```
$ nmap -sC -sV scanme.nmap.org
```

Scan a range of hosts:

```
$ nmap 192.168.1.1-100
```

Perform a fast scan:

```
$ nmap -F 192.168.1.1
```
